

DAILY SECURITY & TRAFFIC REPORT

Date: 05-05-2026 | Generated by SP26IA04

1. EXECUTIVE SUMMARY

This document provides an automated, comprehensive daily overview of the API Gateway traffic and security alerts processed by the AI Threat Detection System. Leveraging advanced machine learning algorithms (LightGBM), the system continuously monitors, analyzes, and mitigates potential threats in real-time, ranging from volumetric DDoS attacks to sophisticated Broken Object Level Authorization (BOLA) attempts.

The metrics below summarize the overall health, traffic distribution, and security posture of the microservices ecosystem over the past 24 hours. A low False Positive rate and stable response times indicate optimal system performance.

Total Requests Processed:	3,439
Normal Traffic (Allowed):	1,238 (36.0%)
Malicious Traffic (Blocked):	2,201 (64.0%)
Global Error Rate (4xx/5xx):	62.05%

HTTP Status Distribution Overview

2. TRAFFIC DETAILS & ENDPOINT UTILIZATION

This section outlines the traffic patterns observed across the core API infrastructure. Understanding peak access times and highly utilized endpoints is crucial for capacity planning, resource allocation, and identifying potential system bottlenecks. Sudden, uncharacteristic spikes in traffic may also correlate with reconnaissance or denial-of-service activities.

Peak Hour (Busiest Traffic): 2:00 - 2:59 UTC

Top 5 Most Accessed Endpoints:

- /api/cart: 2,000 requests
- /api/products: 1,238 requests
- /api/auth/login: 125 requests
- /api/users/by-email/{email}: 46 requests
- /api/my-orders/{id}: 14 requests

3. SECURITY & THREAT ANALYSIS

Our underlying Machine Learning model rigorously analyzed all incoming payloads, request metadata, and behavioral patterns. By correlating extracted features (such as sliding-window request frequencies and double-decoded path syntaxes) against known attack signatures, the AI successfully isolated and neutralized 2,201 high-risk requests today.

Immediate automated responses (e.g., dynamic rate limiting, nftables blacklisting) were executed for critical threats. Below is the detailed breakdown of the most aggressive source IP addresses that warrant continuous monitoring or permanent network-level bans.

Top 5 Most Aggressive IPs (Recommended for Firewall Blacklist):

- 172.20.0.10: 2,201 malicious requests

Malicious Traffic Origin
